

Remove the MPO jumper from the optical module

AI Overview

To safely remove an MPO jumper from an optical module, gently pull the connector straight out while avoiding bending or twisting the fiber, and ensure the module and jumper are clean and undamaged.

Step-by-Step Instructions

- **Power Down or Isolate the Port** Before handling the MPO jumper, ensure the optical module is not actively transmitting signals to prevent potential eye damage or signal disruption.
- **Inspect the Jumper and Module** Check the MPO jumper for any visible damage, kinks, or dirt on the connector. Also, inspect the optical module port for dust or debris, as contamination can affect performance .
- **Release Any Latching Mechanism** MPO connectors often have a push-pull design with a latch. Press the release tab or gently unlock the connector according to the module's design .
- **Pull the Jumper Straight Out** Hold the MPO connector firmly and pull it straight out from the optical module port. Avoid twisting, bending sharply, or applying excessive force, as this can damage the fibers or ferrules .
- **Handle the Fiber Carefully** Keep the fiber jumper supported and avoid sharp bends. MPO jumpers should maintain a minimum bending radius of at least 10 times the cable diameter to prevent signal loss or fiber breakage .
- **Cap the Connector** Once removed, place a dust cap on the MPO connector to protect it from contamination. Similarly, cover the optical module port if it will remain unused for any period
