

Rendering of a suspended cold aisle server room

AI Overview

A suspended cold aisle server room features modular ceiling grids and containment systems that separate cold supply air from hot exhaust, optimizing airflow and cooling efficiency.

Overview of Suspended Cold Aisle Design

In a suspended cold aisle configuration, server racks are arranged in rows with the cold aisle enclosed by modular containment panels. Cold air is supplied from the raised floor or ceiling plenum, while hot exhaust air is captured and directed away from the servers, preventing mixing and improving cooling efficiency. This setup enhances Power Usage Effectiveness (PUE) and allows for higher-density server deployments.

Structural and Modular Components

Suspended cold aisle systems often use modular ceiling grids and structural frames that are independent of the building's primary structure. These frames support containment panels, cable trays, busbars, and integrated electrical services. Pre-assembled modular frames can be delivered and installed quickly, reducing on-site construction time and improving safety by minimizing work at height. Panels and doors are designed to be airtight, maintaining separation between hot and cold air streams
