

Router fiber optic G-port

AI Overview

The "G port" on a fiber optic router is typically the GPON (Gigabit Passive Optical Network) port, used to connect the router directly to a fiber optic line for high-speed internet access.

What the G Port Does

The G port on a fiber optic router serves as the interface between your home network and the fiber optic service provided by your ISP. It is designed to handle GPON connections, which are standard for Fiber-to-the-Home (FTTH) deployments. Through this port, the router receives high-speed internet signals from the optical network terminal (ONT) or directly from the fiber line, supporting downstream speeds up to 2.488 Gbps and upstream speeds up to 1.244 Gbps in compliance with ITU-T G.984 standards (as seen in routers like the TP-LINK TX-W6961N) .

How It Connects

- **Fiber Cable Connection:** The G port connects to the fiber optic cable coming from your ISP. This is usually a single-mode fiber terminated with an SC/APC or LC connector.
- **Router Functionality:** Once connected, the router converts the optical signal into electrical signals for your home network, allowing devices to connect via LAN ports or Wi-Fi.
- **GPON Modem Integration:** Many modern fiber routers integrate a GPON modem, so the G port acts as both the optical input and the gateway for distributing internet throughout your home
