

Spacing between double-layer cable trays in the computer room

AI Overview

The minimum vertical spacing between two layers of cable trays should be at least 150 millimeters (6 inches), while horizontal spacing between parallel trays is typically 0.6 meters (24 inches) or more.

Vertical Spacing

For stacked or multi-level cable trays, the minimum vertical clearance between the upper and lower trays should be 150 millimeters (6 inches). This spacing ensures:

- Adequate room for maintenance and inspection
 - Proper airflow for heat dissipation
 - Reduced risk of cable interference or contact
 - Easier installation of additional trays in the future
- This clearance is generally sufficient for standard computer room environments, but in high-temperature or high-density installations, additional spacing may be beneficial to improve ventilation and cooling .

Horizontal Spacing

When installing two cable trays in parallel at the same height, the recommended horizontal distance is at least 0.6 meters (24 inches). This spacing provides:

- Safe access for technicians to perform maintenance...
