

Specifications and parameters of galvanized cable trays

AI Overview

Galvanized cable trays are steel-based systems with corrosion-resistant zinc coatings, designed to support electrical cables while providing durability and load-bearing capacity in various environments.

Material and Galvanization

Galvanized cable trays are typically made from high-strength steel and finished with either pre-galvanized (electro-galvanized) or hot-dip galvanized coatings. The zinc coating thickness is a critical parameter affecting corrosion resistance:

- Electro-galvanized: thinner coating, suitable for indoor or low-corrosion environments.
- Hot-dip galvanized: thicker coating ($\geq 275 \text{ g/m}^2$ or $\geq 45 \text{ }\mu\text{m}$), ideal for humid, dusty, or chemically aggressive environments. The zinc layer provides sacrificial protection, forming a stable oxide or zinc carbonate layer that protects the steel from corrosion over time.

Load Capacity and Span

Cable trays must be selected based on the maximum expected cable weight and the span between supports:

- Light control cables require smaller trays with shorter spans....
