

Specifications of extruded fiberglass cable trays

AI Overview

Extruded fiberglass cable trays offer high corrosion resistance, lightweight strength, electrical insulation, and durability for harsh industrial environments.

Material and Construction

Extruded fiberglass cable trays are made from fiber-reinforced polymer (FRP) or fiberglass-reinforced plastic, often using pultrusion technology to create strong, uniform profiles. They are available in polyester or vinyl ester resin systems, providing excellent resistance to chemicals, moisture, UV exposure, and extreme temperatures. The pultrusion process ensures a resin-rich surface for superior corrosion protection and long-term durability.

Key Features

- **Corrosion Resistance:** Highly resistant to rust, chemical attack, and environmental degradation, making them ideal for offshore platforms, chemical plants, water treatment, and marine environments.
- **Strength-to-Weight Ratio:** Lightweight yet strong, often weighing one-third of steel trays while maintaining comparable or superior load capacity.
- **Electrical Insulation:** Non-conductive and non-magnetic, reducing shock hazards and interference with radio, radar, or microwave signals.
- **Durability and Longevity:** Resistant to physical wear, UV exposure, and extreme temperatures, ensuring long service life with minimal maintenance.
