

Standard length of galvanized cable trays

AI Overview

Standard galvanized cable trays typically come in widths from 50mm to 900mm and lengths of 3 meters, with heights ranging from 25mm to 150mm depending on cable volume and application.

Standard Widths

Galvanized cable trays are manufactured in a range of nominal inside widths to accommodate different cable loads. Common widths include 100mm, 200mm, 300mm, 450mm, and up to 900mm for large industrial applications. The width determines the tray's cable capacity, and a 25% spare capacity is recommended for future expansion and proper ventilation .

Standard Heights

The height or depth of the tray, often referred to as side rail height, typically ranges from 25mm to 150mm. Taller trays allow for more vertical stacking of cables but increasing width is often more effective for airflow and easier cable installation .

Standard Lengths

Cable trays are usually supplied in 3-meter (approximately 10-foot) straight sections, which balances ease of transport and installation. This length is widely used across manufacturers and simplifies structural design and support spacing .
