

Standard wiring connections for distribution box wire ends

AI Overview

In a distribution box, phase (live), neutral, and earth wires are connected systematically to MCBs, RCCBs, busbars, and earth links to ensure safe and organized power distribution.

Incoming Supply Connections

- **Phase (Live) Wire:** Connect the incoming phase wire from the main supply to the input terminal of the main MCB or double-pole MCB. This serves as the primary switch for the distribution box ().
- **Neutral Wire:** Connect the incoming neutral wire to the neutral busbar. This busbar distributes neutral to all branch circuits ().
- **Earth Wire:** Connect the incoming earth wire to the earth busbar or earth link. If the metallic enclosure is used, it should also be bonded to the earth busbar for safety ().

Protective Device Connections

- **RCCB (Residual Current Circuit Breaker):** The output of the main MCB is connected to the input of the RCCB. The RCCB protects against leakage currents and electrical shocks ().
- **Branch MCBs:** The output of the RCCB is connected to the input terminals of single-pole or double-pole MCBs for individual circuits. Single-pole MCBs are typically used for lighting or standard outlets, while double-pole MCBs may be used for high-power appliances ()....
