

Switching principle of distribution box

Overview

Within the distribution board is a system of circuit breakers, earth leakage circuit breakers, main switches, and possibly power group systems. This allows you to switch groups on, off, and manage them independently. Within the distribution board is a system of circuit breakers, earth leakage circuit breakers. The distribution box is an electrical equipment with the characteristics of small size, easy installation, special technical performance, fixed position, unique configuration function, no site restrictions, widespread application, stable and reliable operation, high space utilization rate, small. The distribution box is to assemble the switchgear, measuring instruments, protective appliances and auxiliary equipment in the closed or semi closed metal cabinet or on the screen according to the electrical wiring requirements to form a low-voltage distribution device. Outgoing feeders from a primary distribution substation are typically feeding secondary distribution substations and bigger, most often industrial type, consumers. A distribution box is a low-voltage electrical enclosure that receives incoming power and distributes it safely to multiple outgoing circuits through protective and switching devices such as MCBs, RCDs, RCBOs, fuses, isolators, busbars, neutral bars, earth bars, and surge protective devices. (2) Similarly, power distribution.
