

Terminal Box for Drop Fiber Optic Cables

AI Overview

A Fiber Optic Drop Cable Terminal Box is a compact enclosure used to terminate, splice, and manage fiber optic drop cables in FTTH and FTTx networks.

Overview

Fiber optic drop cable terminal boxes, also known as FTTH terminal boxes, fiber distribution boxes (FDB), fiber access terminals (FAT), or optical termination boxes (OTB), are designed to provide secure and organized management of fiber optic connections from the network distribution point to end users . They are essential for residential, commercial, and multi-dwelling unit (MDU) installations, ensuring clean signal transmission and protecting splicing points and connectors .

Key Functions

- **Cable Fixing and Protection:** The box mechanically secures incoming fiber cables, protects the fibers from physical damage, dust, and moisture, and provides strain relief .
- **Fusion Splicing:** It allows for splicing of fiber optic cables and pigtails, with excess fiber coiled and stored safely inside the enclosure .
- **Connector Termination:** Connectors attached to pigtails are plugged into adapters within the box, enabling optical path connections to ONTs or other network devices .
- **Distribution and Splitting:** Some boxes accommodate PLC splitters (e.g., 1×8, 1×16) for efficient signal distribution to multiple endpoints .
