

The distribution box is locked in a cage

Overview

North American distribution boards are generally housed in enclosures, with the breakers positioned in two columns operable from the front. Some panelboards are provided with a door covering the breaker switch handles, but all are constructed with a dead front; that is to say the front of the enclosure (whether it has a door or not) prevents the operator of the circuit breakers from contacting live electrical parts within. The main busbar carries the current from incoming line (hot) conductors to the breakers.

AI Overview

A distribution box locked in a cage is a secured electrical panel designed to prevent unauthorized access while ensuring safety and controlled operation.

What is a Distribution Box?

A distribution box (also called a panelboard, breaker panel, or fuse box) is a component of an electrical system that divides incoming power into subsidiary circuits, each protected by a fuse or circuit breaker. It typically includes a main switch, residual-current devices (RCDs), or residual current breakers with overcurrent protection (RCBOs) to safeguard circuits. The enclosure prevents direct contact with live electrical parts, reducing the risk of electric shock during operation or maintenance.

Why Lock a Distribution Box in a Cage?

Locking a distribution box in a cage serves multiple purposes:...
