

The distribution box must have an inner door

AI Overview

Yes, a distribution box should have an inner door or cover to protect live components and ensure safety.

Purpose of the Inner Door

The inner door in a distribution box serves as a protective barrier between the user and the live electrical components such as circuit breakers, fuses, and busbars. It prevents accidental contact, reduces the risk of electric shock, and helps contain sparks or arcs in case of a fault. The inner door also allows for organized cable management and easier maintenance without exposing the entire panel .

Regulatory and Safety Standards

Standards such as IEC 61439, BS 7671, and NEC emphasize the need for protective covers or doors on distribution boards. BS 7671 specifies that metallic distribution boards must have double insulation and covers for live parts, ensuring that users cannot touch energized components directly . NEC 250.148 requires that all metallic parts of the enclosure, including doors, be properly bonded to ground to prevent electrical hazards .

Material and Design Considerations

The inner door can be made of metal or non-metallic materials. Metal doors must b...
