

The distribution box uses a non-standard product

AI Overview

Using a non-standard product in a distribution box can lead to operational faults, safety risks, and compliance issues if not carefully designed and installed.

Understanding Non-Standard Distribution Boxes

A distribution box (DB box) is a central hub that safely distributes electrical power from a main supply to multiple circuits, housing protective devices such as circuit breakers, fuses, and busbars . Standard DB boxes are designed according to strict specifications, ensuring compatibility with DIN rail-mounted devices, proper busbar arrangements, and safe operation under defined temperature and load conditions . Non-standard DB boxes, however, are customized to meet specific customer requirements or unique installation conditions, which may deviate from these standard specifications .

Potential Faults and Risks

Non-standard products in a DB box can introduce several risks:

- Improper selection of electrical components: If AC contactors or circuit breakers are not correctly rated for the load or three-phase balance, they may overheat or fail, especially during high-temperature periods .
- Temperature sensitivity: Low-voltage devices such as fuses, contactors, and residual current devices have defined operating temperature ranges. Exceeding the...
