

The optical module has no light output

AI Overview

If an optical module is not producing light, the issue may stem from hardware failure, port mismatch, fiber incompatibility, or contamination, and can often be resolved through systematic testing and replacement.

Check Optical Module Health

Use an optical power meter to measure the transmit power of the module. If the module is not emitting light or the power is below specifications, the module may be faulty and require replacement . Verify that the module is certified and compatible with your device, as non-certified modules may fail to operate correctly .

Verify Port and Configuration

Ensure that the port settings at both ends match, including speed, duplex, and negotiation mode. Mismatched configurations can prevent the module from transmitting light . If the port is a combo port, confirm it is set to operate as an optical port.

Inspect Fiber and Connectors

Check that the optical fiber type matches the module (single-mode vs. multi-mode). Incompatible fibers prevent the port from going up . Inspect the fiber connectors and module end face for dust, scratches, or contamination, as even minor debris can block light transmission . Clean connectors with appropriate fiber cleaning tools....
