

What are micro-modular data centers

AI Overview

Micro and modular data centers are compact, pre-engineered IT facilities designed for rapid deployment, scalability, and localized data processing.

Overview

Micro data centers are small-scale, self-contained units that house IT equipment within a single rack or a few racks, typically supporting loads up to 100-150 kW. They are ideal for edge locations, remote sites, or space-constrained environments, providing localized computing, storage, and networking while ensuring compliance with data privacy regulations and operational reliability. Modular data centers, on the other hand, are pre-engineered, factory-tested systems that can range from micro-modules to multi-megawatt prefabricated rooms. They are designed to be scalable, allowing organizations to expand capacity incrementally without the need for a full-scale traditional data center build. Modular units include integrated power, cooling, fire suppression, monitoring, and security systems, ensuring consistent performance and operational efficiency.

Key Components

Both micro and modular data centers typically include:

- Uninterruptible Power Supply (UPS) for continuous power during outages.
- Rack Power Distribution Units (rPDU) for efficient load balancing and redundancy.
- Cooling systems optimized for energy efficiency and high-density deployments.
- Physical security measures such as surveillance, locking doors, and fire suppressi...
