

What are non-fire protection electrical distribution boxes

AI Overview

Non-fire protection electrical distribution boxes are standard enclosures that distribute electrical power without specific design features to resist or contain fire.

Definition and Purpose

A non-fire protection electrical distribution box is a type of electrical enclosure used to receive power from a main supply and distribute it safely to multiple branch circuits, but it does not include specialized fire-resistant construction or additional measures to prevent fire propagation . These boxes are designed primarily for organizing circuits, protecting against accidental contact, and facilitating maintenance, rather than mitigating fire risks .

Materials and Construction

Non-fire protection distribution boxes are typically made from metal or plastic. Metal boxes provide mechanical strength and durability, while plastic boxes are lightweight and corrosion-resistant . Unlike fire-rated boxes, these enclosures do not have reinforced walls, intumescent seals, or other fire-retardant features that would prevent internal electrical faults from igniting surrounding materials .

Applications

These boxes are commonly used in environments where fire risk is low and standar...
