

What do the two optical ports on the Huijue switch represent

AI Overview

The two optical ports on a Huawei switch serve as uplink ports for high-speed data transmission over fiber, supporting both pure optical connections and hybrid optical-electrical setups.

Function of the Optical Ports

The optical ports on Huawei switches are primarily uplink ports, designed to connect the switch to upstream devices such as aggregation switches, core switches, or remote units in a campus network . These ports enable high-speed, long-distance data transmission using optical fibers, which provide higher bandwidth and stronger anti-interference capabilities compared to traditional copper Ethernet ports .

Hybrid Optical-Electrical Capability

Huawei switches often support hybrid optical-electrical ports, which can operate in two modes:

- **Optical-Electrical Integration:** The hybrid port uses a hybrid module and cable to transmit data and simultaneously receive PoE power. In this mode, the separate PoE_IN port is not required .
- **Optical-Electrical Separation:** The hybrid port transmits data via a standard optical module, while the PoE_IN port receives power through a Phoenix connector. Both ports in the same group (PoE_IN0 or PoE_IN1) are used together . This flexibility allows the switch to support both fiber-based uplinks and remote PoE-powered devi...
