

What materials are used in the production of mesh cable trays

AI Overview

Mesh cable trays are commonly made from galvanized steel, stainless steel, aluminum, and fiberglass-reinforced plastic (FRP), each chosen for specific environmental and mechanical requirements.

Common Materials

- 1. Galvanized Steel** Galvanized steel is one of the most widely used materials for mesh cable trays. It is robust, cost-effective, and highly durable, with a zinc coating that protects against rust and corrosion. This makes it suitable for industrial environments, outdoor installations, and areas with high humidity. Galvanized steel trays provide excellent mechanical strength and can support heavy cable loads over long spans .
- 2. Stainless Steel** Stainless steel is ideal for harsh or corrosive environments, such as chemical plants, food processing facilities, and areas with high-temperature variations. It offers superior corrosion resistance and long-term reliability, though it is more expensive than galvanized steel. Stainless steel trays are often used where sanitary conditions or chemical resistance are critical .
- 3. Aluminum** Aluminum is lightweight, naturally corrosion-resistant, and easy to handle, making it suitable for suspended installations, commercial buildings, and data centers. Its lower weight reduces the load on supporting structures and simplifies installation. Aluminum trays are commonly used for low- to medium-voltage cable...
