

What to do if the optical module is faulty

AI Overview

Optical module failures can be diagnosed and resolved by systematically checking compatibility, physical connections, optical power, and environmental factors while following preventive maintenance practices.

Common Symptoms of Optical Module Failures

- Link Down: The interface does not come up after module insertion, often caused by poor seating, incompatible modules, or hardware defects .
- Flapping Link: The interface repeatedly goes up and down, which may indicate contamination, fiber damage, or intermittent module faults .
- High CRC or Packet Errors: Traffic quality degrades despite the link being up, often due to signal attenuation, laser drift, or aging components .
- Unsupported Transceiver Alarm: Some switches reject third-party modules due to compatibility issues .
- Short Transmission Distance: The module works but cannot reach the expected distance, possibly caused by mismatched fiber type or module specifications .

Common Causes

- Compatibility Issues: Mismatched wavelength, speed, or fiber type between modules and host equipment can prevent proper operation .
- Optical Port Contamination: Dust, oils, scratches, or fingerprints on ferrules increase signal loss and errors .
- ESD Damage: Static electricity can degrade internal circuits, affecting module lifespan
