

What wires should be installed in the distribution box

AI Overview

Use high-temperature resistant copper wires with cross-sectional areas matched to the load, following standard color codes for phase, neutral, and ground connections.

Wire Material and Type

For distribution boxes, copper wires are recommended due to their excellent conductivity and durability. High-temperature resistant insulation is essential to prevent overheating and ensure long-term safety . Avoid aluminum wires for small-scale residential or commercial distribution boxes unless specifically designed for it.

Wire Gauge Selection

The cross-sectional area of the wire should match the load current of each circuit:

- Lighting and general socket circuits: typically 2.5 mm² copper wire.
- Air conditioning or high-power appliances: 2.5 mm² to 4.0 mm², depending on the load .
- Always calculate the expected current and consider future expansion to avoid overloading.
