

Where does the grounding of the optical cable come from

Overview

Grounding fiber optic cable primarily involves bonding the metallic armor or strength members within the cable to a grounding system to protect against electrical surges and ensure safety. This process prevents voltage buildup and potential damage to connected equipment. The critical distinction lies in. Since an optical fiber cable is non-conductive and there is no electric flowing, there are several advantages over a twisted copper cable in deploying: The non-conductive (dielectric) characteristics of fiber impacts how a designer lays out cabling pathways. [.] One of our readers asked us this question. "What needs to be grounded in a fiber optic network?"

" The standard answer of "everything" seemed illogical and was. This Applications Engineering Note (AE Note) discusses conventional bonding and grounding practices for conductive fiber optic cable and hardware installations within the scope of the National Electrical Code (NEC). 151 refers to the installation of optical fibre ground wire cable.
