

Wiring on the upper and lower walls of the distribution box

AI Overview

In a distribution box, the upper wall is typically used for incoming lines, while the lower wall is used for outgoing lines, with main circuits on the left and control circuits on the right.

Wiring Layout

Incoming and Outgoing Lines: The upper section of the distribution box is generally reserved for incoming power lines, while the lower section is used for outgoing lines to various circuits . This arrangement ensures a clear separation between supply and distribution, reducing the risk of interference and simplifying maintenance. **Main and Control Circuits:** Main circuits are usually installed on the left side of the box, and control circuits on the right . Wiring between the main circuit breaker and branch breakers is typically routed on the left, while wiring exiting the box to loads is routed on the right . **Horizontal and Vertical Wiring:** Wires should be laid out in neat horizontal and vertical paths. Exposed wiring can use sheathed cables or be routed through pipes and trunking, while concealed wiring is usually installed through pipes hidden in walls or decorative panels . This ensures both safety and aesthetic compliance.

Wiring Methods

Exposed Wiring: Can be sheathed or run through conduits and trunking. It is easier to inspect and maintain but must be properly secured with ties and supports . **Conceal...**
